Abstract— Web Services is a technology for building distributed software applications that are built upon a set of information and communication standards. Among those standards is the Web Services Description Language (WSDL) which is an XML-based language for describing service descriptions. Service providers will publish WSDL documents of their Web services so that service consumers can learn about service capability and how to interface with the services. Since WSDL documents are the primary source of service information, readability of WSDL documents is of concern to service providers, i.e. service descriptions should be understood with ease by service consumers. Providing highly readable service descriptions can then be used as a strategy to attract service consumers. However, given highly readable information in the WSDL documents, competitors are able to learn know-how and can copy the design to offer competing services. Security attacks such as information espionage, client impersonation, command injection, and denial of service are also possible since attackers can learn about exchanged data and invocation patterns from WSDL documents. While readability of service descriptions makes Web services discoverable, it contributes to service vulnerability too. Service designers therefore should consider this trade-off when designing service descriptions. Currently there is no readability measurement for WSDL documents. We propose an approach to such measurement so that service designers can determine if readability is too low or too high with regard to service discoverability, service imitation, and service attack issues, and then can consider increasing or lowering service description readability accordingly. Our readability measurement is based on the concepts or terms in service domain knowledge. Given a WSDL document as a service description, readability is defined in terms of the use of difficult words in the description and the use of words that are key concepts in the service domain. As an example, we measure readability of the WSDL document of public Web services, and outline a method to lower or increase readability.

Keyword—Concept Hierarchy, Ontology, Readability, Web Services, WSDL

Pananya Sripairojthikoon was born in Bangkok, Thailand, 20 November 1987. She obtained a Bachelor of Engineering in computer engineering (International Program) from King Mongkut University of Technology Thonburi, Bangkok, Thailand in 2010. Currently she is a Master student in software engineering at Department of Computer Engineering, Faculty of Engineering, Chulalongkorn University, Bangkok, Thailand. She has also been with Accenture Thailand since June 2012 as a software engineer. Previously she worked as a software developer for Software Link Co., Ltd, Thailand from April 2010 to April 2012. Her research interests include service-oriented computing and semantic technology.

Twittie Senivongse received a Ph.D. in computer science from University of Kent, Canterbury, UK, in 1997 and has been working for Department of Computer Engineering, Faculty of Engineering, Chulalongkorn University in Bangkok, Thailand since then. She is currently an associate professor and her research interests include service-oriented computing, business process modeling, and semantic technology.
