Abstract—Optical Carrier Suppression has proven as an efficient way of generating high frequency optical carrier for Radio over Fiber (RoF) systems. However, previous studies show that OCS with the combination of RF and optical components can only transmit a single service in RoF system. This paper shows that two different services can be transmitted using a single wavelength through RoF system with the use of Polarization Multiplexing (PolMux) method. The combination of these two techniques enables multiservice RoF such as LTE and WiFi services to be transmitted simultaneously to the customers.

Keyword—Local Multipoint Distribution Service (LMDS), Multiservice, Optical Carrier Suppression (OCS), Polarization Multiplexing (PolMux), Radio over Fiber (RoF)

Mohd Hafiz Mohamad Nor received a BSc in Computer Engineering (Electrical) from the Universiti Teknologi Malaysia (UTM) in 2012. The Author is currently a Senior Assistant Researcher at Telekom Malaysia Research & Development (TM R&D). Major field of study includes the area of Radio over Fiber (RoF) using OCS and SBS methods in carrier generation. Current interests include polarization multiplexing and PON technology. Recent works also include designing and fabricating MZM and optical amplifier electronic controllers such as EDFA and SOA.

Thavamaran Kanesan received his BEng in Electrical & Electronic Engineering from the University of Northumbria, Newcastle in 2009 and is PhD in Electrical Engineering in 2013. He is currently a Senior Researcher at Telekom Malaysia Research & Development (TM R&D). His major field of study includes the area of Radio over Fiber (RoF), LTE and WiFi. He currently leads projects involving convergence of optical and wireless communication.

Farha Maskuriy received her Bachelor in Applied Science in Engineering Physics in 2007 and MSc in Solid State Physics from the Universiti Sains Malaysia (USM) in 2008. She is currently a Researcher at Telekom Malaysia Research & Development (TM R&D). Her current work involves nonlinear SBS methods in carrier generation as well as optical polarization multiplexing and simulation.

Ashaari Yusof received his BSc in Electrical Electronics Engineering from University of Southern California in 2000 and MSc in Physics from Universiti of Sains Malaysia (USM). He is currently a Senior Researcher at Telekom Malaysia Research & Development (TM R&D). He has been involved in microwave photonics and Radio over Fiber focusing on green fiber wireless and multiservice delivery. Current interests include optimization works on multiplexing access schemes using polarization and WDM via experimentation and simulation

Mohd Faiz Aizad Abdul Fatah received his MSc in Microelectronic from Universiti Malaysia Perlis (UniMAP). He is currently a Researcher at Telekom Malaysia Research & Development (TM R&D). His current work involves interworking of LTE and WiFi in fixed wireless access network. Other research interests are microwave and photonics such as RoF, and WDM.

Siti Barirah Ahmad Anas received her BEng from Universiti Putra Malaysia (UPM) in 1999, her MSc from Universiti Putra Malaysia (UPM) in 2003 and her PhD in 2009 from the University of Essex, specializing in optical CDMA. She is currently an associate professor in the Faculty of Engineering, UPM and active executive committee member of the IEEE Photonics Society, Malaysia Chapter. Her interests include optical communication and networks.
